## Distributed Messaging Service: Client Start Here Service Manager Service Proxy Passes **Registers Operation** Client Calls Method Service Method Info Info as Pending on Service Proxy to Service Manager **Operation State Builds Websocket** Message and Send on Websocket Operation No Yes Timed Out? Service Manager Service Manager **Removes Pending** Receives Result from Websocket **Operation State** Service Manager Service Manager Hands Timeout Hands Result or Exception to Callback **Exception to Callback** Client Callback Every service proxy methods returns void Message is 3 part binary message: and provides an additional argument for Length of header in bytes (32 bit int)

the caller to specify a callback. These callbacks handle successes & failures.

- Header (byte array, UTF8 JSON or XML) 2.
- Body (byte array, UTF8 JSON or XML) 3.

## Distributed Messaging Service: Generators

```
@implementation MyMessageService
#pragma mark Message Service
- (void) sayHelloWithCallback:(Callback*) aCallback myName:(NSString*) aMyName
{
    MethodInfo* info = [MethodInfo info];
    info.channel = @"MyMessageService";
    info.destination = @"sayHello#java.lang.String";
    info.args = [NSArray arrayWithObjects:aMyName];
    info.callback = aCallback;
    [self.manager callWithInfo:info];
}
@end
```

```
Service Queue Workers

public class MessageServiceWorker extends ServiceWorker
{
}
```
